🐾 PawPal+

Welcome to the PawPal+ starter app.

This file is intentionally thin. It gives you a working Streamlit app so you can start quickly, but **it does not implement the project logic**. Your job is to design the system and build it.

Use this app as your interactive demo once your backend classes/functions exist.

Scenario

PawPal+ is a pet care planning assistant. It helps a pet owner plan care tasks for their pet(s) based on constraints like time, priority, and preferences.

You will design and implement the scheduling logic and connect it to this Streamlit UI.

What you need to build

At minimum, your system should:

- Represent pet care tasks (what needs to happen, how long it takes, priority)
- Represent the pet and the owner (basic info and preferences)
- Build a plan/schedule for a day that chooses and orders tasks based on constraints
- Explain the plan (why each task was chosen and when it happens)

Owner Setup

Owner name

Jordan

Daily time available (minutes)

120 − +

Active owner in session: Jordan

Add Pet

Pet name

Mochi

Species

dog

Pet age

2 − +

Add pet

Current pets:

	name	species	age
0	Mochi	dog	2
1	Solon	cat	5
2	Carvajal	other	13

Add Task

Task title

Morning walk

Duration (minutes)

20 − +

Priority

high

Time (HH:MM)

08:00

Recurrence

none

Assign to pet

Mochi
